Ą

Your system supplier for every aspect of power transmission

We say what we mean and mean what we say.

We see things from our customers' perspective.

We are considerate of our employees and their families as well as of our environment and society.

RINGFEDER POWER TRANSMISSION is the global market leader in the niche markets of drive technology and is well regarded for its customer-specific, application-oriented solutions that ensure excellent and failure-free operation for its clients. We offer locking devices, damping technology and couplings for OEMs but also for the final customer under our strong brand name RINGFEDER[®].

We do not only provide competent advice to our customers on the basis of our 90 years of experience but also develop innovative ideas in cooperation with them. This is part of our aspiration to be a **Partner for Performance**.

Around the power transmission we promise

- Excellent know-how for our challenging customers
- Best cost-benefit ratio
- Short reaction times and a high product availability

Your projects are our drive

Know-how: Over 90 years of expertise.

Rely on decades of engineering expertise from the inventor of the friction spring. As an expert in drive and damping technology, we are your reliable partner wherever forces are at work. Be it the permanent transfer of very high torques due to non-positive or positive connections or the absorption and trapping of extreme energies to protect expensive constructions.

Your expert partner: From development to the finished product.

We accompany you through to the successful completion of your project. Beginning with the development phase of your project, we offer our know-how and professional solutions. By working together with global market leaders and as an international supplier of outstanding products and special solutions, we are a reliable partner for you.

Online calculation program: Always find the right solution.

In response to the complex requirements involved in the correct selection and design of the required products under practical conditions, we have developed our online calculation program. Engineers and experts are able to calculate transferable torques and other important values, taking into account various parameters. Visit our website **www.ringfeder.com!**

On-site worldwide: We are there for you. Anytime, anywhere.

With our locations in Germany, the Czech Republic, the USA, Brazil, China and India as well as a worldwide service and partner network, we are there for you around the clock. This ensures our support for the successful completion of your projects at any time.

Steel Disc Couplings **RINGFEDER® TND**

Torsionally rigid, absolutely backlash-free RINGFEDER® TND Steel Disc Couplings are suitable for the most diverse applications and particularly ideal for all drive tasks requiring freedom from wear and maintenance as well as excellent misalignment compensation and positioning accuracy. The core component of these powerful couplings are disc packs developed on the basis of in-depth FEM analysis. They consist of multiple circular, torsionally flexible single discs made of stainless spring steel which are connected by means of high-precision sleeves to form a compact unit. High-strength fitting screws alternately connect the disc packs, if necessary via mounted spacers, with the input-side and output-side coupling hub, so that the required torque is transmitted reliably, precisely and safely by the steel discs which are loaded by tension and compression. The high-precision sleeves with their specifically produced relief grooves decisively contribute to minimizing load peaks that mainly affect the outer discs when shaft misalignments occur.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) for increased compensation capability at occuring shaft misalignments, and the type HT (High Torque) with larger power density for higher requirements on transmissible torque. Thanks to the unitized design of this series and the extensive, highly flexible modular system, including various hub types, mounting options as well as spacer variants and lengths, there is always one coupling version available that is optimally suited for the individual application of our users. Moreover, customized special solutions can also be realized at short delivery times in specific case of need.

TAT

One Coupling Series, Numerous Advantages

Zero Backlash

RINGFEDER[®] Steel Disc Couplings transmit the required torque in both directions with zero backlash – an indispensable precondition for their use in machines and plants with synchronous operation, frequent starts and stops or reversing operation. They are also the perfect choice for applications requiring the highest positioning accuracies and for variable-speed drives.

Torsional Stiffness

The premium-quality all-steel construction and the optimal design of the disc packs, made of corrosion-resistant spring steel, ensure an

outstanding torsional stiffness. This makes RINGFEDER[®] Steel Disc Couplings particularly designated for use in drive lines running at very high speeds and accelerations.

Misalignment Compensation

The FEM-optimized high-strength steel disc packs as well as their reliable attachment to the coupling hubs and possible spacers not only ensure extremely precise torque transmission by means of a combination of frictional and positive locking. They also effectively compensate for angular, axial, and, depending on the coupling type, radial shaft misalignment with minimum restoring forces.

Running Accuracy

First-class material quality combined with advanced machining processes at very tight production tolerances and a compact design, ensure the highest concentricity accuracies resulting in a particularly smooth and quiet running behavior at low vibration levels – even in drive applications involving enormous rotational speeds or irregular rotational forces.

Freedom from Wear and Maintenance

Provided that the stated selection and operation criteria are adhered to, RINGFEDER[®] Steel Disc Couplings are not subject to wear and do not require cleaning or lubrication. When properly in-

stalled, they are expected to have a virtually infinite service life. Their superior operational reliability precludes cost-intensive repairs and plant downtimes.

Temperature Resistance

Thanks to their all-steel construction and the resulting resilience, RINGFEDER[®] Steel Disc Couplings impress with maximum performance and reliability, even under extreme thermal loads. They can be installed in temperatures ranging from -20 °C to 240 °C and are, therefore, also suitable for use in high-temperature pump systems.

RINGFEDER[®] Steel Disc Couplings can of course be supplied in compliance with ATEX according to Product Directive 2014/34/EU and DIN EN ISO 80079-36:2016 if required.

Disclaimer of liability

All technical details and notes are non-binding and cannot be used as a basis for legal claims. The users are obligated to determine whether the represented products meet their requirements. We reserve the right to carry out modifications at any time in the interests of technical progress.

Coupling Configuration

From the outset, the RINGFEDER[®] TND series has been designed as a highly flexible modular system so that customers will always benefit from a coupling solution that is optimally suited to their specific application requirements. Customized special designs made-to-order which go beyond the individualization and selection options of the standard coupling types offered can thus be realized efficiently upon request. Generally, every coupling type is composed of an input-side

Coupling Hubs

RINGFEDER[®] Steel Disc Couplings comprise an input-side and output-side coupling hub of various construction types. Depending on the type, the hubs are mounted onto the shafts by either using keyways or RINGFEDER[®] Shrink Discs. The conventionally and thus typically used hub type is the standard hub designated by the letter H. If the hub diameter is reduced such that the hub is inverted when mounted and is hence hidden in the spacer, this hub type is designated with the letter V. The shaft-hub connection is established by a keyway for both H-Hubs and V-Hubs.

As shafts with very smooth surfaces are increasingly being used in today's compact gear units, a higher contact pressure of the hub onto the shaft is required to ensure safe and reliable torque transmission by frictional locking. To this end, the back side of the H-Hubs

and output-side coupling hub as well as a connecting element that is either embodied by a single disc pack or by a spacer with two disc packs attached on both sides. The modular design principle and the resulting combination possibilities are also reflected in the denomination of the different coupling types: The three-letter name of a specific coupling type is derived from the respective manifestation of both the hubs and the connecting elements.

is specifically prepared by suitable machining to be equipped with high-quality RINGFEDER[®] Shrink Discs. The resulting hub type is designated with the letter X. The specific assignment of three-part shrink discs of the RfN 4061 series to the individual coupling sizes allows for quick and easy selection of a suitable shrink disc.

In the case of couplings with a short length and a compact-spacer, two disc packs are fastened to the spacer by means of longer fitting screws that pass through the spacer. For geometrical reasons, this special kind of screw connection necessitates an opening of the hub flanges. Depending on the type of the shaft-hub connection, these hubs are either designated with the letter O (connection by keyway) or with the letter Q (connection by RINGFEDER[®] Shrink Disc).

Hub H Standard Hub

Hub V Inverted Hub

Hub O Standard Hub with Open Flange

Hub X Hub with Shrink Disc

Hub Q Hub with Open Flange and Shrink Disc

Connecting Elements

Depending on the coupling type, either a single disc pack or spacers of different variants with two disc packs screwed to them on both sides serve as connecting elements between the hubs. Single disc packs are designated with the letter S. Spacers with the double number of disc packs are designated with the letters D or C respectively.

Coupling types with a single disc pack have single-jointed designs and are only capable of compensating angular and axial shaft misalignments between the connected aggregates, whereas double-jointed designs with two disc packs can also accommodate radial misalignments. Spacers with the designation D are available in various standard lengths as well as customized special lengths of up to 3 meters which allow for the adaptation to prevailing site conditions and provide for the ability to bridge even very long shaft distances. The designation D describes a particularly short, compact-spacer that can be mounted and dismounted radially.

In coupling types equipped with either a spacer D or C, one disc pack each is alternately connected to the spacer and one coupling hub, thus achieving the function of a double-cardanic system.

Disc Packs

The FEM-optimized disc packs are the characteristic and functional key element of the RINGFEDER® Steel Disc Couplings. The packs are comprised of multiple circular single discs of the same thickness made of corrosion resistant spring steel. These discs are firmly connected to form a compact unit by means of precision sleeves. To reduce stress peaks that are mainly applied to the outer discs when shaft misalignments occur, the precision sleeves dispose of specifically produced relief grooves. High-strength fitting screws alternately connect the disc packs with the coupling hubs and any mounted spacers. The bolt circle, the number of screwing points and the width of the disc packs determine the level of torque that can be transmitted, whereas the distance of the disc packs to each other and the thickness of the single discs define the capability to compensate for shaft misalignments. Depending on the preference and application-specific requirements, customers may choose from two different disc pack types as a function of the coupling size:

The type HD (High Deflection) with thin single discs for increased compensation capability at occuring shaft misalignment. Up to and including the coupling size 169, this type allows for continuous operation at an angular misalignment of up to 1.0 degrees under consideration of the coupling dimensioning details.

The type HT (High Torque) is used if higher requirements are placed on the torque that can be transmitted. By virtue of thicker single discs, the torque capacity is increased by up to 30 % and a higher power density is hence obtained. With due consideration of the coupling dimensioning details, continuous operation at an angular misalignment of maximal 0.7 degrees is possible for coupling sizes up to and including 169.

6 Screwing Points Size 47-169

8 Screwing Points Size 205-316

Spacer D with 2 Disc Packs

Compact-Spacer C with 2 Disc Packs

Screwing

The disc packs are typically connected by means of high-strength special screws. Depending on the coupling size, hexagon socket screws or hexagon head screws are used.

The contact pressure of the disc pack on the other coupling components, which is generated by the screw tightening torque, provides for friction-locked transmission of the required torque. It is therefore necessary that the contact surfaces are dry and free from any matter like preservative agents or paint. Up to and including the coupling size 98, hardened washers are fitted below the screw heads. From size 118 up, such washers are also used underneath the self-locking nuts.

In ambient temperatures above 80°C, the typically used selflocking nuts with plastic insert have to be replaced by all-steel nuts.

Hexagon Socket Screw Size 47-141

Hexagon Head Screws Size 169-254

Hexagon Socket Screws with Special Nut Size 262-316

Modular System

The smart modular system of the RINGFEDER® TND series guarantees users maximum flexibility and customizability to fulfil the specific requirements of their individual drive task. By virtue of the various combination possibilities and multiple extension options, further coupling types are realizable in addition to those depicted above. These include other hub combinations, the replacement of hubs by connecting flanges or functional supplements like brake discs or brake drums as well as anti-flail devices. Furthermore, the couplings can also be installed vertically by using simple supports.

Coupling Dimensioning

Selection Guide

The selection of the correct coupling size is based on the torque to be transmitted and the given shaft dimensions. In addition, other conditions of the specific application situation have to be considered, e.g. operating speed, shaft misalignments and the need for spacers to accommodate larger shaft distances. Always make sure that the specified limit values are never exceeded at any operating condition. Should you have questions or need technical support, please contact our experts in Engineering and Sales.

The nominal torque T_{KN} of the $\mathsf{RINGFEDER}^{\circledast}$ TND Steel Disc Couplings can be transmitted continuously if the specified selection and operating criteria are met. Coupling dimensioning is based

on the nominal torque T_N and the maximum torque T_{max} of the machinery.

1. Calculate the nominal torque of the machine to be transmitted T_N

| Equation 1) | ΤN | = Nominal torque of machine | [Nm] |
|--|----------------|-----------------------------------|---------|
| | PN | Machine power | [kW] |
| T _N = 9,550 · P _N / n _N | n _N | = Operating speed | [1/min] |

2. Determine the required nominal torque for the coupling T_{KN}

Equation 2)

$$T_{KN} \geq T_N \cdot S_\vartheta \cdot S_f$$

| T _{KN} | Nominal torque of coupling | [Nm] | acc. to data in the Tech Paper |
|-----------------|--|------|--------------------------------|
| ΤN | = Nominal torque of machine | [Nm] | acc. to Equation 1) |
| Sϑ | = Temperature factor | [-] | acc. to Table 1) |
| Sf | = Service factor | [-] | $S_A \cdot S_L$ |
| SA | = Load factor on drive side | | |
| SL | = Load factor of output side | | |
| | | | |

To prevent damage to the self-locking nuts of the screwing of the disc pack, ambient temperatures above 80 °C have to be communicated to RINGFEDER POWER TRANSMISSION beforehand. Specifically designed coupling versions are available for temperatures below -20 °C and above 240 °C.

Table 1: Temperature Factor S_{ϑ}

| Ambient Temperature Range ϑ [°C] | Temperature Factor ${f S}_\vartheta$ |
|--|--------------------------------------|
| -20 °C < ୬ < 160 °C | 1.0 |
| 160 °C < ϑ < 190 °C | 1.1 |
| 190 °C < ୬ < 240 °C | 1.3 |

 S_A is the load factor for the input side. It defaults to $S_A = 1$ for electric motor drives. $S_A > 1$ applies to drives by combustion engines and it is recommended to check the selection of the coupling size by means of a detailed torsional vibration analysis. Please contact the expert team of RINGFEDER POWER TRANSMISSION for further guidance.

Table 2: Load Factor Output Side

| Torque Characteristics at Operating Point on Output Side | Torque Curve | Min. Load Factor S _L |
|--|--------------|---------------------------------|
| Constant, uniform torque load, without torque variations | T (Nm) | 1.1 |
| Uniform with little torque variations; slight shocks | T (Nm) | 1.5 |
| Non-uniform, also API 671, API 610 moderate shocks | T (Nm) | 1.75 |
| Non-uniform, fluctuating, heavy shocks | T (Nm) | 2 |
| Other torque patterns and reversing operation | T (Nm) | 2.5 |

3. Check the impact of short-term torque peaks acting on the coupling

4. Make certain that the coupling is capable of handling the occurring shaft misalignments

Existing or expected angular, axial and radial shaft misalignments shall not exceed the maximum values as specified in the Tech Papers of the individual coupling types. Coupling types with one single disc pack are capable of compensating angular and axial shaft misalignments. Couplings equipped with two disc packs can also compensate radial shaft misalignment. The individual misalignment values are interdependent; to ensure safe and continuous transmission of the required torque, the maximum misalignment values may not occur simultaneously. If one of the misalignment values is close to the permissible limit value, this will have an effect on the misalignment values in other directions and on the torque that can be transmitted. The selection of a coupling with larger misalignment capacities is therefore recommended.

4.1 Couplings with one disc pack (e.g. coupling type TND HSH)

Couplings with one single disc pack are capable of accommodating axial and angular misalignment, but not radial shaft misalignment. Accordingly, the following equation applies:

4.2 Couplings with two disk packs (e.g. coupling type TND HDH)

Couplings with two disc packs are able to compensate for axial, angular and radial shaft misalignment. Accordingly, the following equation applies:

Diagram 2: Miasalignment Chart for Couplings with two Disc Packs (Double-Jointed Design)

The following equation applies per disc pack:

 $\Delta K_{WBB} \leq 1/2 \cdot \Delta K_W - \Delta K_{WB}$

| $\Delta \textbf{K}_{\textbf{W}}$ | = | Max. angular misalignment |
|----------------------------------|---|---------------------------------|
| ΔK_{WB} | = | Machine-related angular mis- |
| | | alignment in state of operation |

 $\Delta \mathbf{K}_{\mathbf{WRB}} = \text{Angle due to radial misalignment}$

[deg.] acc. to data in the Tech Paper [deg.]

[deg.]

To calculate the maximum radial misalignment which can be continuously transmitted by the coupling, the lowest value of $\Delta K_{\text{WRB-min}}$ is used to determine ΔK_{rB} .

Equation 7)

Equation 6)

 $\Delta K_{rRB} = tan (\Delta K_{WRB-min}) \cdot (E-H_3)$

E = Distance between the hubs H_3 = Width of the disc pack [mm] acc. to data in the Tech Paper [mm] acc. to data in the Tech Paper

www.ringfeder.com

5. Check the hub bores and operating speeds to prevent exceeding permissible maximum values

Arrangement of the coupling components

The coupling hubs have to be mounted onto the shafts to be connected in accordance with the respective coupling type. It is recommended to mount the coupling hubs flush with the shaft ends to establish the most solid shaft-hub connection.

Bores

The values for d_{1kmax}/d_{2kmax} (max. bore diameter) indicated in the Tech Papers for the individual coupling types apply to keyed connections according to DIN 6885-1. These values may only be exceeded upon prior review and approval by RINGFEDER POWER TRANSMISSION. The maximum possible bore diameters for connections with square keys according to ANSI B17.1 are to be reduced upon consultation with RINGFEDER POWER TRANSMISSION.

In order to achieve sufficient concentricity, the bore fit must be selected so that the shaft tolerance pairing results in a tight fit or interference fit (e.g. H7/m6) or tighter. Detailed data needs to be provided for hydraulically fitted shaft-hub connections.

Fastening on the shafts

RINGFEDER[®] Steel Disc Couplings with standard or inverted hubs come with keyways according to DIN 6885-1 and a keyway width tolerance P9 as standard (tolerance JS9 upon customer specification). In addition, axial securing, e.g. via set screws or distance rings, needs to be provided for use with longer shaft ends. Keyways according to ANSI B17.1, keyways with special dimensions or other keyway tolerances can also be realized upon request.

For couplings with hubs of the designation X and Q, the hub is fastened by RINGFEDER[®] Shrink Discs of the three-part series RfN 4061 which are placed on the back of the hubs. By tightening the high-strength locking screws, the tapered thrust rings of the shrink disc are axially clamped against each other on an inner ring, so that pressure is applied from outside via the hub onto the joint between shaft and hub. This provides for backlash-free transmission of the torque by frictional locking. The transmissible torque of these coupling types can be obtained from their corresponding Tech Papers.

6. Check whether dynamic effects need to be considered

Bearing of shaft ends

Bearings are required for the shafts ends to be connected directly in front of and behind the coupling.

Balancing

On account of the extremely high manufacturing precision of the coupling components, balancing of the coupling is only required for applications involving very high operating speeds or because of sensitivity of the driving and driven units. From a peripheral speed of 30 m/s, separate balancing of the individual coupling parts is recommended.

Without further instructions on balancing, the coupling parts are balanced individually according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs are balanced half key (before grooving) and spacers are balanced without screwed-on disc packs.

Critical operating speed

On account of the coupling construction, the fastening of a spacer between two disc packs will result in a system susceptible to dynamic excitation. In order to prevent the operating accuracy from being adversely affected by axial vibrations, the bending critical speed has to be verified in the case of operating speeds of 3,500 1/min and higher, and spacer lengths of 1.2 meters and longer.

Important!

It is mandatory to observe the stated selection and operation criteria as well as the instructions contained in the respective assembly and operation manuals. Should you have any questions or need technical support, please consult our experts in Sales and Engineering.

Dimensioning Examples

Example 1

A RINGFEDER[®] Steel Disc Coupling is required for an agitator operating in an ambient temperature of 180 °C. An electric motor type 315M with an input shaft diameter of 80 mm drives the output shaft, diameter 85 mm, with a power of 132 kW and a speed of 1,460 1/min. The distance between the shaft ends is 100 mm and the load should be transmitted via a keyed connection.

Desired coupling type: RINGFEDER[®] TND HDH

 $T_{Kipp} = 2.5 \cdot T_N = 2.5 \cdot 864 \text{ Nm} = 2,115 \text{ Nm}$

2,115 Nm · 1 · 1.1 = 2,330 Nm

| Machine power P _N = | 132 kW for the el. motor type 315 M | |
|---|--|---------------------|
| Operating speed n_N = | 1,460 1/min | |
| Nominal torque of machine $T_N =$ | $9,550 \cdot P_N / n_N = 9,550 \cdot 132 / 1,460 = 864 \text{ Nm}$ | acc. to Equation 1) |
| Ambient temperature ϑ = | 180 °C | acc. to Table 1) |
| | 1.1 | acc. to Table 1) |
| → Load factor S L = | non-uniform torque curve, moderate shocks = 1.75 | acc. to Table 2) |
| Required nominal torque of coupling T_{KN} = | $T_N \cdot S_{\vartheta} \cdot S_f = 846 \text{ Nm} \cdot 1.1 \cdot 1.75 = 1,629 \text{ Nm}$ | acc. to Equation 2) |
| | | |
| For non-reversing torque S_Z | 1 | |
| Ambient temperature ϑ = | 180 °C | acc. to Table 1) |
| Temperature factor S_{ϑ} = | 1,1 | acc. to Table 1) |

Since a keyed connection is requested and because the shaft distance has to be bridged by a spacer, the steel disc coupling type

Max. torque of machine T_{max} =

Max. torque T_{Kmax} =

TND HDH is selected. To match the shaft distance of 100 mm, a spacer length of 100 mm (E = 100 mm) is required.

acc. to Equation 3)

| Coupling Selection: TND HDH, Size 118, Spacer Length E = 100 mm | | | |
|---|---------------------|--|--|
| T_{KN} Drive = 1,629 Nm \leq 2,400 Nm = T_{KN} Coupling | | | |
| T _{Kmax} 2,330 Nm ≤ 1.75 · 2,400 Nm = 4,200 Nm | acc. to Equation 3) | | |
| n _N 1,460 1/min ≤ 3,800 1/min | | | |

The shafts are aligned according to the below mentioned misalignment values which are expected to occur during operation. On this basis, the utilization of the maximum possible misalignment compensation capacity is verified. The operating speed of 1,460 1/min corresponds to a peripheral speed of 12.7 m/s. Therefore, no balancing will be necessary.

| Misalignment values in state of operation | $\Delta K_{aB} = 0.5 \text{ mm}$ $\Delta K_{WB} = 0.5^{\circ}$ $\Delta K_{rB} = 0.7 \text{ mm}$ | |
|---|---|---------------------|
| Verification of the misalignment values | 0.5 mm / 2.4 mm + 0.5° / 2° + 0.7 mm / 1.4 mm = 0.95 \leq 1 | acc. to Equation 5) |

Verification of the dimensioning result

| Machine Data | | Coupling Data |
|--------------------------|--------------------------------|------------------|
| Nominal torque | 1,629 Nm (incl. safety factor) | 2,400 Nm |
| Maximum torque | 2,330 Nm (incl. safety factor) | 4,200 Nm |
| Speed | 1,460 1/min | max. 3,800 1/min |
| Shaft diameter, motor | 80 mm | max. 85 mm |
| Shaft diameter, agitator | 85 mm | max. 85 mm |

Example 2

A RINGFEDER[®] Steel Disc Coupling is intended to be used for the drive of a kneading machine. The gear unit provides a nominal torque of 12,000 Nm at a speed of 120 1/min. The input shaft has a diameter of 150 mm and the output shaft has a diameter of 135 mm. The shaft tolerance is g6 each. The distance between the shaft ends amounts to 300 mm. The maximum torque of the machine is 30,000 Nm. Further requirements are reversing operation and an ambient temperature of 110 °C. Shrink discs are to be used for the shaft-hub connection on both sides.

| Operating speed $\mathbf{n_N} =$ | 120 1/min | |
|--|---|---------------------|
| Nominal torque of machine $\mathbf{T_N}$ = | 12,000 Nm | |
| Ambient temperature ϑ = | 110 °C | acc. to Table 1) |
| Temperature factor S_{ϑ} = | 1 | acc. to Table 1) |
| Load factor $\mathbf{S}_{\mathbf{L}}$ = | for reversing operation $= 2.5$ | acc. to Table 2) |
| Required nominal torque of coupling T_{KN} = | $T_{N} \cdot S_{\vartheta} \cdot S_{f} = 12.000 \text{ Nm} \cdot 1 \cdot 2,5 = 30.000 \text{ Nm}$ | acc. to Equation 2) |

| For reversing torque S_Z | 1.5 | |
|---|---------------------------------|---------------------|
| Ambient temperature ϑ = | 110 °C | acc. to Table 1) |
| > Temperature factor S_{ϑ} = | 1 | acc. to Table 1) |
| Max. torque of machine T_{max} = | 30,000 Nm | |
| Max. torque T_{Kmax} = | 30,000 Nm · 1 · 1.5 = 45,000 Nm | acc. to Equation 3) |

On account of the required shrink disc connection and use of a spacer to bridge the shaft distance, the steel disc coupling type TND XDX

size 254 with HD disc pack is selected. To match the shaft distance of 300 mm, a spacer length of 300 mm (E = 300 mm) is chosen.

| Coupling Selection: TND XDX, Size 254, Spacer Length E = 300 mm | |
|---|---------------------|
| T_{KN} drive = 30,000 Nm <= 36,000 Nm = T_{KN} coupling | |
| T _{Kmax} 45,000 ≤ 1.75 · 36,000 = 63,000 Nm | acc. to equation 3) |
| n _N 120 1/min ≤ 2,100 1/min | |

The shafts will be aligned according to the below mentioned misalignment values which are assumed to occur during operation. On this basis, the utilization of the maximum possible misalignment compensation capacity is verified.

| Misalignment values in state of operation | $\begin{array}{l} \Delta K_{\text{aB}} = 0.3 \text{ mm} \\ \Delta K_{\text{WB}} = 0.3^{\circ} \\ \Delta K_{\text{rB}} = 1.0 \text{ mm} \end{array}$ | |
|---|---|---------------------|
| Verification of the misalignment values | 0.3 mm / 2.2 mm + 0.3° / 1° + 1 mm / 2.2 mm = 0.89 ≤ 1 | acc. to equation 5) |

The sizes of the RINGFEDER® RfN 4061 Shrink Discs that match the respective coupling hubs are listed in the Tech Paper for the coupling type TND XDX. In this example, the size 200 x 350

is selected for the input shaft (diameter 150 mm), and the size 185 x 330 mm for the output shaft (diameter 135 mm).

| Transmissible torque T RfN 4061 185 x 330 with d = 135 mm | 52,500 Nm |
|---|-----------|
| Transmissible torque T RfN 4061 200 x 350 with d = 150 mm | 75,000 Nm |

Verification of the dimensioning result

| | Machine Data | Coupling Data |
|---------------------------------|--------------|------------------|
| Nominal torque | 12,000 Nm | 36,000 Nm |
| Maximum torque | 30,000 Nm | 63,000 Nm |
| Speed | 120 1/min | max. 2,100 1/min |
| Shaft diameter, motor | 150 mm | max. 160 mm |
| Shaft diameter, kneader | 135 mm | max. 160 mm |
| Shrink disc connection, motor | 45,000 Nm | 75,000 Nm |
| Shrink disc connection, kneader | 45,000 Nm | 52,000 Nm |

In this case, the maximum torque T_{kmax} of the complete system is limited by the lower torque that can be transmitted by the shaft-hub-connection, and therefore is set to 52,500 Nm.

Steel Disc Couplings RINGFEDER® TND HSH

Standard Hubs, Single-Jointed, without Spacer

The type **RINGFEDER® TND HSH** is a torsionally stiff, backlashfree steel disc coupling consisting of two standard hubs H and one disc pack S alternately connected to the hubs by high-strength screws.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The single-jointed design with single disc pack compensates for angular and axial shaft misalignments.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular and axial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Quick and easy realization of a double-cardanic setup by means of two couplings and one spacer
- Bore diameter d_{1/2} up to 215 mm
- Transmissible torque T_{KN} up to 130,000 Nm / T_{kmax} up to 220,000 Nm
- Rotational speeds n_{max} up to 8,400 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND HDH

Standard Hubs, Double-Jointed, with Spacer

The type **RINGFEDER® TND HDH** is a torsionally stiff, backlashfree steel disc coupling consisting of two standard hubs H as well as a spacer D in standardized or individually customized length. Using high-strength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for radial (adjustable via the spacer length), angular and axial shaft misalignments.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Bridging of large shaft distances by means of spacers in various standard and freely customizable special lengths
- Bore diameter d_{1/2} up to 215 mm
- Transmissible torque T_{KN} up to 130,000 Nm / T_{kmax} up to 220,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 8,400 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND HDV

Combination of Standard Hub and Inverted Hub, Double-Jointed, with Spacer

The type **RINGFEDER**[®] **TND HDV** is a torsionally stiff, backlash-free steel disc coupling consisting of a standard hub H and an inverted hub V, connected by a spacer D in standardized or individually customized length. Using high-strength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for radial (adjustable via the spacer length), angular and axial shaft misalignments.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Bridging of large shaft distances by means of spacers in various standard and freely customizable special lengths
- Bore diameter in standard hub H d₁ up to 175 mm, in inverted hub V d₂ up to 120 mm
- Transmissible torque T_{KN} up to 44,000 Nm / T_{kmax} up to 77,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 8,400 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND VDV

Further information on **RINGFEDER® TND VDV** on **www.ringfeder.com**

Inverted Hubs, Double-Jointed, with Spacer

The type **RINGFEDER® TND VDV** is a torsionally stiff, backlash-free steel disc coupling consisting of two inverted hubs V, connected by a spacer D in standardized length. Using highstrength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for radial (adjustable via the spacer length), angular and axial shaft misalignments. By utilizing the standard spacers, the largest possible disc pack distance and thus the largest possible radial misalignment is realized at minimum distance of the shafts to be connected.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Bridging of large shaft distances by means of spacers in various standard lengths
- Maximum radial misalignment at minimum shaft distance
- Bore diameter d_{1/2} up to 120 mm
- Transmissible torque T_{KN} up to 44,000 Nm / T_{kmax} up to 77,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 8,400 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND OCO

Standard Hubs with Open Flange, Double-Jointed, with Compact-Spacer

The type **RINGFEDER® TND OCO** is a torsionally stiff, backlashfree steel disc coupling consisting of two standard hubs with open flange O and a compact-spacer C that can be installed and removed radially. Using high-strength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for angular, axial and radial shaft misalignments with minimum axial space requirement.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Minimum shaft distance for standard hubs

- Radially install- and removeable compact-spacer
- Bore diameter d_{1/2} up to 65 mm
- Transmissible torque T_{KN} up to 1,750 Nm / T_{kmax} up to 3,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 8,400 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND XSX

🧇 RINGFEDER

Hubs with RINGFEDER[®] Shrink Discs, Single-Jointed, without Spacer

The type **RINGFEDER® TND XSX** is a torsionally stiff, backlashfree steel disc coupling consisting of two hubs X prepared to be equipped with shrink discs of the series RINGFEDER® RfN 4061 and one disc pack S alternately connected to the hubs by highstrength screws.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The single-jointed design with single disc pack compensates for angular and axial shaft misalignments.

A permanently backlash-free fixation of the coupling hubs on the shafts to be connected is realized by means of high-quality RINGFEDER® Shrink Discs.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular and axial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Quick and easy realization of a double-cardanic setup by means of two couplings and one spacer
- Simplified shrink disc selection thanks to RINGFEDER[®] Shrink Discs specifically assigned per coupling size
- Bore diameter d_{1/2} up to 160 mm
- Transmissible torque T_{KN} up to 44,000 Nm / T_{kmax} up to 77,000 Nm
- Rotational speeds n_{max} up to 3,600 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND XDX

Hubs with RINGFEDER[®] Shrink Discs, Double-Jointed, with Spacer

The type **RINGFEDER® TND XDX** is a torsionally stiff, backlash-free steel disc coupling consisting of two hubs X prepared to be equipped with shrink discs of the series RINGFEDER[®] RfN 4061 and a spacer D in standardized or individually customized length. Using high-strength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for radial (adjustable via the spacer length), angular and axial shaft misalignments.

A permanently backlash-free fixation of the coupling hubs on the shafts to be connected is realized by means of high-quality RINGFEDER® Shrink Discs.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Bridging of large shaft distances by means of spacers in various standard and freely customizable special lengths
- Simplified shrink disc selection thanks to RINGFEDER[®] Shrink Discs specifically assigned per coupling size
- Bore diameter d_{1/2} up to 160 mm
- Transmissible torque T_{KN} up to 44,000 Nm / T_{kmax} up to 77,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 3,600 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

Steel Disc Couplings RINGFEDER® TND QCQ

Hubs with Open Flange and RINGFEDER[®] Shrink Discs, Double-Jointed, with Compact-Spacer

The type **RINGFEDER® TND OCO** is a torsionally stiff, backlash-free steel disc coupling consisting of two hubs with open flange Q prepared to be equipped with shrink discs of the series RINGFEDER® RfN 4061 and a compact-spacer C that can be installed and removed radially. Using high-strength screws, one disc pack each is connected to the spacer and one hub, thus achieving the function of a double-cardanic system.

Depending on the coupling size, two different disc packs are available: The type HD (High Deflection) as well as the type HT (High Torque). The double-jointed design with two disc packs compensates for angular, axial and radial shaft misalignments with minimum axial space requirement.

A permanently backlash-free fixation of the coupling hubs on the shafts to be connected is realized by means of high-quality RINGFEDER® Shrink Discs.

- Completely backlash- and maintenance-free
- Highly effective compensation of angular, axial and radial shaft misalignment
- Torsionally rigid with high torsional stiffness
- Low restoring forces in case of shaft misalignment due to optimum disc pack design
- Minimum shaft distance for standard hubs
- Radially install- and removeable compact-spacer

- Simplified shrink disc selection thanks to RINGFEDER[®] Shrink Discs specifically assigned per coupling size
- Bore diameter d_{1/2} up to 70 mm
- Transmissible torque T_{KN} up to 1,750 Nm / T_{kmax} up to 3,000 Nm
- Rotational speeds depending on spacer length n_{max} up to 3,600 1/min
- Efficient realization of customer-specific solutions at short delivery times thanks to modular design

 When selecting the size, it is essential to observe the instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER[®] Steel Disc Couplings". Short-term peak torque T_{kmax} is limited to 1.75 multiples of T_{KN}.

3) Pre-bore has free tolerance.

4) Maximum finished bore with keyways according to DIN 6885-1.

6) Weight and mass moments of inertia for pre-bored hubs.

7) The maximum misalignment values must not apply simultaneously. The instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER[®] Steel Disc Couplings" are to be observed.

Without further specifications, we deliver as standard: Bore tolerance H7; Keyway acc. to DIN 6885-1; Keyway width tolerance P9; Set screw per hub.
 From a peripheral speed of 30 m/s, separate balancing of the individual coupling

Without further instructions on balancing, the coupling parts are balanced individu-

ally according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs are

1) When selecting the size, it is essential to observe the instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER® Steel Disc Couplings". Short-term peak torque T_{kmax} is limited to 1.75 multiples of $T_{\mbox{KN}}$

5) Longer spacers on request. The figures given at " Δ per 100 mm" for Gw_{SB}, J_{SB}, $C_{\mathsf{Tdyn}}\mathsf{HD}$ and $C_{\mathsf{Tdyn}}\mathsf{HT}$ are approximate values.

6) Weight and mass moments of inertia for pre-bored hubs.

2) For longer spacers, check bending critical rotational speed.

3) Pre-bore has free tolerance.

4) Maximum finished bore with keyways according to DIN 6885-1.

7) The maximum misalignment values must not apply simultaneously. The instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER® Steel Disc Couplings" are to be observed.

Explanations

| T _{KN} HD | Nom. transmissible torque with disc pack HD | D ₁ = Max. outer diameter |
|--------------------|---|---|
| | | D ₂ = Outer diameter hub |
| T _{KN} HT | Nom. transmissible torque with disc pack HT | L ₂ = Hub flange thickness |
| | | L = Total length |
| n _{max} | = Max. rotational speed | S _D = Disassembly space |
| d _{pre} | = Diamater pre-bore | nsc = Quantity of screws |
| d _{1kmax} | Max. bore diameter d₁ with keyway acc. to DIN 6885-1 | Gwsb = Weight at smallest bore |
| d _{2kmax} | Max. bore diameter d₂ with keyway acc. to DIN 6885-1 | JSB = Moment of inertia at sn diameter. |
| C1 | = Guided length in hub bore | C_{Tdyn}HD = Dynamic torsional stiffr with disc pack HD |
| C ₂ | Guided length in hub bore | 1 |
| E | = Distance between hubs | C_{Tdyn}HT = Dynamic torsional stiffr with disc pack HT |
| H ₃ | = Width of the disc pack | |

Technical Information

- Without further specifications, we deliver as standard: Bore tolerance H7; Keyway acc. to DIN 6885-1; Keyway width tolerance P9; Set screw per hub.
- From a peripheral speed of 30 m/s, separate balancing of the individual coupling parts is recommended.
- Without further instructions on balancing, the coupling parts are balanced individually according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs are balanced half key (before grooving), the spacer without screwed-on disc packs.

 When selecting the size, it is essential to observe the instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER[®] Steel Disc Couplings". Short-term peak torque T_{kmax} is limited to 1.75 multiples of T_{KN}.

2) For longer spacers, check bending critical rotational speed.

3) Pre-bore has free tolerance.

4) Maximum finished bore with keyways according to DIN 6885-1.

5) Longer spacers on request.

6) Weight and mass moments of inertia for pre-bored hubs.

7) The maximum misalignment values must not apply simultaneously. The instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER[®] Steel Disc Couplings" are to be observed.

Steel Disc Couplings RINGFEDER® TND VDV

Further information on **RINGFEDER® TND VDV** on **www.ringfeder.com**

Technical Information

- Without further specifications, we deliver as standard: Bore tolerance H7; Keyway acc. to DIN 6885-1; Keyway width tolerance P9; Set screw per hub.
- From a peripheral speed of 30 m/s, separate balancing of the individual coupling parts is recommended.
- Without further instructions on balancing, the coupling parts are balanced individually according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs are balanced half key (before grooving), the spacer without screwed-on disc packs.

Disclaimer of liability

The transmissible torque of the coupling is dependent on the selected disc pack as well as the type of the shaft-hub connection. The lower torque limits the transmissibility and must be taken as a basis for the selection of the coupling.

Technical Information

- The specified values for transmissible torques are valid as follows: Shaft tolerance h6 for shaft diameters up to 50 mm; Shaft tolerance g6 for shaft diameters from 50 mm; Surface quality $R_a \le 3.2 \mu m$.
- From a peripheral speed of 30 m/s, separate balancing of the individual coupling parts is recommended.
- Without further instructions on balancing, the coupling parts are balanced individually according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs are balanced without screwed-on disc pack.

 When selecting the coupling size, it is essential to observe the instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER® Steel Disc Couplings". Short-term peak torque T_{kmax} is limited to 1.75 multiples of T_{KN} or by the transmissible torque T of the shrink disc.

2) For longer spacers, check bending critical rotational speed.

3) Bore tolerance H6 up to diameter 80 mm; Bore tolerance H7 from diameter 80 mm.

5) Longer spacers on request. The figures given at " Δ per 100 mm" for Gw_{sp} , $C_{Tdyn}HD$ and $C_{Tdyn}HT$ are approximate values.

7) The maximum misalignment values must not apply simultaneously. The instructions on coupling dimensioning in the document "Product Paper & Tech Paper RINGFEDER[®] Steel Disc Couplings" are to be observed.

The transmissible torque of the coupling is dependent on the selected disc pack as well as the type of the shaft-hub connection. The lower torque limits the transmissibility and must be taken as a basis for the selection of the coupling.

Further information on **RINGFEDER® TND QCQ** on **www.ringfeder.com**

Technical Information

- The specified values for transmissible torques are valid as follows: Shaft tolerance h6 for shaft diameters up to 50 mm; Shaft tolerance g6 for shaft diameters from 50 mm; Surface quality $R_a \le 3.2 \mu m$.
- From a peripheral speed of 30 m/s, separate balancing of the individual coupling parts is recommended.
- Without further instructions on balancing, the coupling parts are balanced individually according to DIN 21940-11 in quality G 6,3 at 1,500 1/min. The hubs and the spacer are balanced without screwed-on disc packs.
