Your system supplier for every aspect of power transmission

We say what we mean and mean what we say.

We see things from our customers' perspective.

We are considerate of our employees and their families as well as of our environment and society.

RINGFEDER POWER TRANSMISSION is the global market leader in the niche markets of drive technology and is well regarded for its customer-specific, application-oriented solutions that ensure excellent and failure-free operation for its clients. We offer locking devices, damping technology and couplings for OEMs but also for the final customer under our strong brand name RINGFEDER®.

We do not only provide competent advice to our customers on the basis of our 90 years of experience but also develop innovative ideas in cooperation with them. This is part of our aspiration to be a **Partner for Performance**.

Around the power transmission we promise

- Excellent know-how for our challenging customers
- Best cost-benefit ratio
- Short reaction times and a high product availability

Know-how

Over 90 years of expertise.

On-site worldwide

We are there for you. Anytime, anywhere.

Your expert partner

From development to the finished product.

Customer

Value

Online calculation program

Always find the right solution.

Your projects are our drive

Know-how: Over 90 years of expertise.

Rely on decades of engineering expertise from the inventor of the friction spring. As an expert in drive and damping technology, we are your reliable partner wherever forces are at work. Be it the permanent transfer of very high torques due to non-positive or positive connections or the absorption and trapping of extreme energies to protect expensive constructions.

Your expert partner: From development to the finished product.

We accompany you through to the successful completion of your project. Beginning with the development phase of your project, we offer our know-how and professional solutions. By working together with global market leaders and as an international supplier of outstanding products and special solutions, we are a reliable partner for you.

Online calculation program: Always find the right solution.

In response to the complex requirements involved in the correct selection and design of the required products under practical conditions, we have developed our online calculation program. Engineers and experts are able to calculate transferable torques and other important values, taking into account various parameters. Visit our website www.ringfeder.com!

On-site worldwide: We are there for you. Anytime, anywhere.

With our locations in Germany, the Czech Republic, the USA, Brazil, China and India as well as a worldwide service and partner network, we are there for you around the clock. This ensures our support for the successful completion of your projects at any time.

RINGFEDER®

Locking Assemblies

Introduction

Keyless shaft-hub locking devices have been the cornerstone of the RINGFEDER®. For over 90 years, our product offering of internal clamping and external clamping locking devices and global support has been unparalleled in the industry.

Characteristics

- **Inexpensive manufacture** – the large tolerances that are possible and the simple turning process guarantee inexpensive manufacture.
- **Simple installation** – only a few screws need to be tightened, alignment to precise angles between the hub and shaft is possible in any position, no fitting work is required.
- **Simple dismantling** – RINGFEDER® Locking Assemblies are fitted with threaded extraction holes, so that no additional auxiliary equipment is necessary, series RfN 7012 is self-releasing.
- **Large constant reverse-torsion fatigue strength** – shaft and hub are ungrooved, so that there is no weakening of these

Locking Assemblies self-centering

Self-centring RINGFEDER® Locking Assemblies enable extremely precise concentricity in the clamped components. The maximum concentricity error for the clamping sets that are machined in a clamping process is an extremely low 0.04 mm. These clamping sets are used primarily in gear wheel mountings in rotary pumps and in machine tools that require the highest level of precision.

Locking Assemblies without axial displacement

RINGFEDER® Locking Assemblies without axial displacement of the hub during assembly are used when this kind of displacement would affect the function of the connection negatively. This kind of clamp set is used primarily in the area of machine tools, helical gear wheels, rotary table drives, pumps and brake disc mountings.

Locking Assemblies with low surface pressures

RINGFEDER® Locking Assemblies with low surface pressures minimise the tension in the components jointed by the set. They are used mainly in the case of extremely thin-walled hubs and for hubs with low yield strength or made of grey cast iron or aluminium. Aluminium timing belt pulleys and thin-walled levers are typical areas of use.

components. Shaft and hub can be designed to be considerably smaller (light, cost and space-saving design possible).

- **No danger of deflection** – RINGFEDER® Locking Assemblies are absolutely backlash-free.
- **Effect similar to overload protection** – after the set frictional connection force has been exceeded the Locking Assemblies simply slide. Valuable machine parts are protected. The Locking Assemblies are subject to the same laws as any other connection with force transmission by friction - not suitable as sliding clutch.
- **Completely maintenance-free** – no follow-up costs.

Locking Assembly selection on www.ringfeder.com

Our website offers you a selection tool that will help you to determine which locking assembly is suitable for you.

Following selection criteria are available:

- **transmissible torque at given T_A or shaft diameter**

Additional filter criteria:

- **axial displacement** (with or without)
- **self-centering** (yes or no)

Disclaimer of liability

All technical details and notes are non-binding and cannot be used as a basis for legal claims. The user is obligated to determine whether the represented products meet his requirements. We reserve the right carry out modifications at any time in the interests of technical progress.

Locking Assemblies

RINGFEDER®

RINGFEDER® locking assemblies are characterised by the absolute freedom of movement and high fatigue properties of the components. The fast, simple assembly is achieved through the use of few screws. The angle of alignment between the shaft and the hub is thus exact in every position. No adjustment work is necessary. Simple dismantling is carried out using extraction threads – no additional aids are necessary. The RfN 7012.2 series is even self-releasing.

RfN 7003

Further information on
RINGFEDER® RfN 7003
on www.ringfeder.com

self-centering
without axial displacement
with low surface pressure

Two piece design with slit and single taper and without flange

Self-centering, 2-piece Locking Assemblies, which can be used - due to the slit - also at larger tolerances. The hub slightly positions during mounting towards the screw head. For disassembly only few release screws are required. Through the stiffer geometry of the flange, the deformation of the flange is significantly lower than with standard products.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. During mounting, minor axial displacement occurs towards of the screw head. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured.
- **High rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.

RfN 7004

Further information on
RINGFEDER® RfN 7004
on www.ringfeder.com

self-centering
without axial displacement
with low surface pressure

Extended version of the RfN 7003

Is the extended design of series RfN 7003. Here, due to the low pressure the hub can be designed very cost-effective (small outer diameter).

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. During mounting, minor axial displacement towards of the screw head. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured.
- **High rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.

RfN 7005

RINGFEDER® RfN 7005
 on www.ringfeder.com

self-centering
without axial displacement
with low surface pressure

Three piece self-centering design for heavy duty torques

3-piece, self-centering, slitted Locking Assemblies for highest torques. During assembly a minor axial displacement of the hub occurs. The front and rear thrust rings are separately released through release threads.

Characteristics

- **Excellent concentricity** – because of the long, flat cone
- **Special features** – low axial displacement and highest torque transfer

RfN 7006

Further information on
RINGFEDER® RfN 7006
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Two piece design with single taper

Has all positive features of series RfN 7003. However, through the bigger flange diameter an axial displacement of the hub during mounting is averted. Is also applied with belt pulleys.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. During mounting, minor axial displacement towards of the screw head. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured.
- **High rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.
- **Axial hub positioning** – the increased outer diameter of the flange prevents the axial movement of the hub during assembly and improves the run-out ability of the Locking Assembly.

RfN 7007

Further information on
RINGFEDER® RfN 7007
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Two piece design similar to RfN 7004

Is a modification of RfN 7004 with all its positive features, but here - same as RfN 7006 - the axial displacement during mounting is averted.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured.
- **Higher rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.
- **Axial hub positioning** – in addition to this, the hub is fixed axially during the assembly by the inserted ring, and a high level of axial run-out accuracy is also achieved.
- **Low surface pressure** – also suitable for thin-walled hubs with a small extension length and for exactly positioned impellers.

RfN 7012

RINGFEDER® RfN 7012
 on www.ringfeder.com

Large transmittable forces and moments

Slimmest design, especially suitable for applications where space is limited. The Locking Assembly RfN 7012 compensates small tolerance deviations and compensates small mounting errors.

Characteristics

- **Large transmittable forces and moments** – several Locking Assemblies RfN 7012 can be placed one behind the other. The transmissible torque and axial forces are added - please take in this respect consulting with our technical experts.
- **Bending moment and radial loads** – combined loads can be transmitted. (Please contact our technical department for assistance).
- **Easy installation** – RfN 7012 Locking Assemblies can bridge large clearances without the loss of transmission values.
- **Low risk to contamination** – during the tightening process the functional surfaces of the device and connection are pressed together generating a surface pressure that does not allow the ingress of contamination.
- **Free from wear** – the Locking Assembly RfN 7012 works without moving parts on shaft and hub, through this, abrasive wear and backlash are avoided. Thus, RfN 7012 can be repeatedly clamped and released.

RfN 7012.2

- self-centering
- without axial displacement**
- with low surface pressure

Further information on RINGFEDER® RfN 7012.2 on www.ringfeder.com

Large transmittable forces and moments

Dimensions as for RfN 7012, narrowest structure, particularly suited to applications in narrow spaces. The non self-centring locking assembly RfN 7012.2 offsets small tolerance fluctuations and compensates for slight assembly errors.

Characteristics

- **Large transmittable forces and moments** – several Locking Assemblies RfN 7012.2 can be placed one behind the other. The transmissible torque and axial forces are added - please take in this respect consulting with our technical experts.
- **Bending moment and radial loads** – combined loads can be transmitted. (Please contact our technical department for assistance).
- **Easy installation** – RfN 7012.2 Locking Assemblies can bridge large clearances without the loss of transmission values.
- **Low risk to contamination** – during the tightening process the functional surfaces of the device and connection are pressed together generating a surface pressure that does not allow the ingress of contamination.
- **Free from wear** – the Locking Assembly RfN 7012.2 works without moving parts on shaft and hub, through this, abrasive wear and backlash are avoided. Thus, RfN 7012.2 can be repeatedly clamped and released.

RfN 7013.0

Further information on
RINGFEDER® RfN 7013.0
on www.ringfeder.com

self-centering

without axial displacement

with low surface pressure

Excellent concentricity and very easy to dismantle

The locking assemblies RfN 7013.0 achieve particularly good concentricity between the clamped parts. The reinforced flange prevents the inner ring from bending and lifting during the assembly. This ensures an easy dismantling. Particularly suitable for higher speeds and radial loads.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. During mounting, minor axial displacement occurs towards of the screw head. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured. On the smaller sizes only the cone is slotted on the inner ring and the flange remains unslotted. This prevents crooked pulling during the assembly. From an internal diameter of 55 mm both rings are completely unslotted.
- **High rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.

RfN 7013.1

Further information on
RINGFEDER® RfN 7013.1
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Axial hub fixing, excellent concentricity and very easy to dismantle

The locking assembly RfN 7013.1 has the same positive characteristics as RfN 7013.0, but differs in its lifted flange. This fixes the hub axially during assembly and also achieves a high level of axial run-out accuracy. A large number of screws guarantees almost the same high transferable torque as for the locking assemblies RfN 7013.0.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. The flange is reinforced at the critical point. This prevents a bending and lifting of the inner ring during installation and therefore a good dismantling is ensured. On the smaller sizes only the cone is slotted on the inner ring and the flange remains unslotted. This prevents crooked pulling during the assembly. From an internal diameter of 55 mm both rings are completely unslotted.
- **High rotation speed** – the Locking Assemblies remain true-to-form during assembly and so they are suitable in applications with higher rotational speeds.
- **High radial loads** – the material strength of the Locking Assemblies makes them especially suitable for applications with high radial loads.
- **Axial hub positioning** – the increased outer diameter of the flange prevents the axial movement of the hub during assembly and improves the run-out ability of the Locking Assembly.

RfN 7014

Further information on
RINGFEDER® RfN 7014
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Large transmittable peripheral forces

The long, flat cones allow the highest torques and/or axial forces to be transferred with a locking assembly RfN 7014. The multiple part structure means that the locking assembly, shaft and hub remain in the same position to one another during assembly and no axial shift takes place. The shaft and hub are only pressurised, guaranteeing additional safety compared to 3-part types.

Characteristics

- **Large transmittable peripheral forces** – due to the long, flat cones it is possible to transmit maximum torques and axial forces with one self-centering Locking Assembly RfN 7014.
- **Maximum reliability** – due to the flat cones and the relatively wide construction (large guide lengths) the Locking Assemblies RfN 7014 centre themselves. During installation the Locking Assembly, shaft and hub remain in position to one another. The shaft and hub are loaded by pressure, providing additional safety compared to 3-part versions.
- **Note** – The shaft or hub must be dropped in order to guarantee simple dismantling.

RfN 7015.0

Further information on
RINGFEDER® RfN 7015.0
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Transfer of greatest bending moments possible, greatest torque and/or axial forces, excellent concentricity possible

Self-centering precision Locking Assembly for the transmission of maximum torques and axial forces with special demands on the concentricity of the parts of the clamped, as well as for applications subjected to bending moments.

Characteristics

- **Large transmittable peripheral forces** – due to the long, flat cones it is possible to transmit maximum torques and axial forces with **one** Locking Assembly RfN 7015.0. During installation the Locking Assembly, shaft and hub remain in position to one another. Compared to 3-part versions, thus an additional safety is provided. Shaft and hub are only compression-loaded. If necessary, two locking assemblies RfN 7015.0 can be positioned behind one another. The transferred torque and axial forces are added – please consult with our technical experts in this regard.
- **Bending moment and radial loads** – combined loads can be transmitted. Please contact our technical department for assistance.
- **Excellent centering ability** – because of the centring ridge and relatively wide structure.

RfN 7015.1

Further information on
RINGFEDER® RfN 7015.1
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Reduced surface pressures

Locking Assembly for transmission of torques, axial forces and high bending moments at reduced contact pressures, with special requirements to the true running of the clamped pieces.

Characteristics

- **Large transmittable peripheral forces** – due to the long, flat cones it is possible to transmit maximum torques and axial forces with one Locking Assembly RfN 7015.0. During installation the Locking Assembly, shaft and hub remain in position to one another. Compared to 3-part versions, thus an additional safety is provided. Shaft and hub are only compression-loaded. If necessary, two locking assemblies RfN 7015.1 can be positioned behind one another. The transferred torque and axial forces are added – please consult with our technical experts in this regard.
- **Bending moment and radial loads** – combined loads can be transmitted. Please contact our technical department for assistance.
- **Excellent centering ability** – because of the centring ridge and relatively wide structure.

RfN 7061

RINGFEDER® RfN 7061
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Two piece, self-centering design

Self-centering, cost-efficient 2-piece Locking Assemblies for medium torques. During mounting, minor axial displacement of the hub occurs. Due to the small number of screws, cost savings during mounting are ensured. For disassembly only few release screws are required. Also available for very small shaft diameters.

Characteristics

- **Special features** – also suitable for thin-walled hubs with a low extension limit because of the low surface pressure.
- **Availability** – also available for very small shaft diameters.
- **Very good concentricity** – because of the rings formed as a double cone.

RfN 7110

Further information on
RINGFEDER® RfN 7110
on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Specially small dimensioned self-centering Locking Assembly without axial displacement

Specially small dimensioned self-centering Locking Assembly without axial displacement. As the locking screws are located out of the actual clamping area and the pressures are relatively low, the hub can be designed economically small.

Characteristics

- **Low surface pressure** – also suitable for thin-walled hubs with a low extension limit.
- **Availability** – also available for very small shaft diameters.
- **Compact** – particularly suited for applications in narrow spaces because of the low structural height.

RfN 7515

RINGFEDER® RfN 7515
on www.ringfeder.com

self-centering
without axial displacement
with low surface pressure

Three piece Locking Assembly

The self-centering precision Locking Assembly for transmission of torques, axial forces and special optimised for the transmission of bending moments, with special requirements to the true running of the clamped pieces.

Characteristics

- **Special features** – Through the long and flat cones one Locking Assembly RfN 7515 can transmit torques and axial forces and bending loads. During mounting occurs a slight axial movement from Locking Assembly and hub.
- **Bending moment and radial loads** – combined loads can be transmitted. Please contact our technical department for assistance.
- **Excellent centering ability** – with a relatively wide design.

Locking Assemblies stainless steel **RINGFEDER®**

Stainless steel products of RINGFEDER® have to be used if machinery, components and systems must be cleaned intensely and high resistance is necessary. High-strength, stainless special screws are used for this purpose.

RfN 7012

Further information on
RINGFEDER® RfN 7012 stainless steel

- self-centering
- without axial displacement**
- with low surface pressure

Large transmittable forces and moments

Slimmest design, especially suitable for applications where space is limited. The Locking Assembly RfN 7012 stainless steel compensates small tolerance deviations and compensates small mounting errors.

Characteristics

- **Large transmittable forces and moments** – several Locking Assemblies RfN 7012 stainless steel can be placed one behind the other. The transmissible torque and axial forces are added - please take in this respect consulting with our technical experts.
- **Easy installation** – in comparison to cross-press fits temperature treatments and fitting are eliminated. Locking Assemblies RfN 7012 stainless steel can cover a big fitting clearance.
- **Low risk to contamination** – during tightening process the functional surfaces of the device and connection are pressed together generating a surface pressure that does not allow the ingress of contamination.
- **Free from wear** – the locking screw torque can be changed giving a corresponding change in transmission values. RfN 7012 stainless steel Locking Assemblies can be tightened and released repeatedly.

RfN 7013.1

Further information on
RINGFEDER® RfN 7013.1 stainless steel
 on www.ringfeder.com

- self-centering
- without axial displacement
- with low surface pressure

Axial hub fixing, excellent concentricity and very easy to dismantle

The locking assembly RfN 7013.1 has the same positive features as 7013.0, but differs in its lifted flange. This fixes the hub axially during assembly and also achieves a high level of axial run-out accuracy. A large number of screws guarantees almost the same high transferable torque as for the locking assemblies RfN 7013.0.

Characteristics

- **Excellent concentricity and very easy to dismantle** – these self-centering Locking Assemblies provide particularly good concentricity between the clamped parts. The flange is reinforced at the critical point, preventing bending or lifting of the inner ring during assembly and thereby ensuring easy dismantling.
- **High rotation speed** – the dimensional accuracy allows their use in applications with higher rotational speeds.
- **High radial loads** – the material strength makes them especially suitable for applications with high radial loads.
- **Axial hub positioning** – the increased outer diameter of the flange prevents the axial movement of the hub during assembly and improves the run-out ability of the locking assembly.

Specially small dimensioned self-centering Locking Assembly without axial displacement

Specially small dimensioned self-centering Locking Assembly without axial displacement. As the locking screws are located out of the actual clamping area and the pressures are relatively low, the hub can be designed economically small.

Characteristics

- **Low surface pressure** – also suitable for thin-walled hubs with a low extension limit.
- **Availability** – also available for very small shaft diameters.
- **Compact** – particularly suited for applications in narrow spaces because of the low structural height.

Calculation

Equations for thick-walled cylinders give good service in the estimation of the tangential (tension) stresses occurring in the hub and hollow shaft. Exact determination of the true stresses and deformations (expanding, contraction) is very difficult in view of the

wide scatter of the coefficients of friction and because of the differing hub and hollow shaft configurations. Constructions in which Locking Assemblies are intended to be arranged under or above bearings should therefore be avoided as far as possible, or be more closely investigated (e. g. test clamping).

Hub calculation

- 1) $p_N \approx p_W \cdot \frac{d}{D}$
- 2) $a_N = \frac{D_N}{D}$
- 3) $\sigma_{tiN} = \frac{p_N(a_N^2 + 1)}{a_N^2 - 1}$; $L_N = L_3$
- 4) $\sigma_{taN} = \frac{2 \cdot p_N}{a_N^2 - 1}$; $L_N = L_3$
- 5) $\sigma_{tiN} = \frac{C_3 \cdot p_N \cdot (a_N^2 + 1)}{a_N^2 - 1}$; $L_N > 2L_3$
- 6) $\sigma_{taN} = \frac{C_3 \cdot p_N \cdot 2}{a_N^2 - 1}$; $L_N > 2L_3$
- 7) $D_N \cong D \cdot \sqrt{\frac{R_{p0,2N} + C_3 \cdot p_N}{R_{p0,2N} - C_3 \cdot p_N}}$ a)
- 8) $D_N \cong D \cdot \sqrt{\frac{R_{p0,2N} + C_3 \cdot p_N}{R_{p0,2N} - C_3 \cdot p_N} + 2D_G}$ b)
- 9) $\Delta D_N \approx \frac{D_N \cdot \sigma_{taN}}{E_N}$ c)
- 10) $p_{Nzul.} \approx \frac{R_{p0,2N}}{C_3} \cdot \frac{D_N^2 - D^2}{D_N^2 + D^2}$ a)

Shaft calculation

- 1) $a_W = \frac{d}{d_B}$
- 2) $\sigma_{tiW} \approx 2 \cdot p_W \cdot C_3 \cdot \frac{a_W^2}{a_W^2 - 1}$
- 3) $\sigma_{taW} \approx p_W \cdot C_3 \cdot \frac{a_W^2 + 1}{a_W^2 - 1}$
- 4) $d_B \cong d \cdot \sqrt{\frac{R_{p0,2W} - 2 \cdot p_W \cdot C_3}{R_{p0,2W}}}$ a)
- 5) $d_B \cong d \cdot \sqrt{\frac{R_{p0,2W} - 2 \cdot p_W \cdot C_3}{R_{p0,2W}} - 2D_G}$ b)
- 6) $\Delta d_B \approx \frac{d_B \cdot \sigma_{tiW}}{E_W}$
- 7) $\Delta d \approx \frac{p_W \cdot d \cdot (m - 1)}{E_W \cdot m}$ c)
- 8) $R_{p0,2W} > p_W$ c)
- 9) $p_{zul.} \approx \frac{R_{p0,2W} \left[1 - \left(\frac{d_B}{d} \right)^2 \right]}{C_3 \cdot 2}$ a)

Sectional views

Explanation

a) Cross section of the hub above the Locking Assembly, unweakened

$C_3 = 0,6$ for one Locking Assembly and $L_N \geq 2 \cdot L_3$

$C_3 = 0,8$ for two or more Locking Assemblies and $L_N \geq L \cdot (1 + n)$; $n =$ number of Locking Assemblies

$C_3 = 1$ for one or more Locking Assemblies and $L_N = L_3$ resp. $L_N = L \cdot n$

b) If bores or threads (D_G) in the hub

$C_3 = 0,8$ if $L_N \geq 2 \cdot L_3$ resp. $L_N \geq L \cdot (1 + n)$

$C_3 = 1$ if $L_N = L_3$ resp. $L_N = L \cdot n$

c) Approximated value. A higher scatter range is possible, as the value depends on the actual coefficient of friction and the shape of the hub.

Locking Assemblies RINGFEDER® RfN 7005

Explanation

d = Inner diameter	T = Transmissible torque at given T_A	D_G = Thread
D = Outer diameter	F_{ax} = Transmissible axial force	T_A = Max tightened torque of the clamping screws
L = Overall length	p_w = Surface pressure on shaft at given T_A	G_w = Weight
L₁ = Overall length (without screws)	p_N = Surface pressure on hub at given T_A	
L₃ = Width of ring	n_{Sc} = Quantity of screws	

Ordering example

Locking assembly	d	D
RfN 7005	35	60

Technical Information

- Surface finishes: Shaft and hub bores $R_a \leq 1,6 \mu\text{m}$
- Tolerances: Shaft: h8 · Hub: H8

Explanation

d = Inner diameter	L₄ = Installation length up to collar	D_G = Thread
D = Outer diameter	T = Transmissible torque at given T _A	T_A = Max tightened torque of the clamping screws
D_{B1} = Collar outer diameter	F_{ax} = Transmissible axial force	G_w = Weight
L = Overall length	p_W = Surface pressure on shaft at given T _A	
L₁ = Overall length (without screws)	p_N = Surface pressure on hub at given T _A	
L₃ = Width of ring	n_{Sc} = Quantity of screws

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	T_A = Tightening torque of the clamping screws
D = Outer diameter	p_w = Surface pressure on shaft at given T _A	Gw = Weight
L = Overall length	p_N = Surface pressure on hub at given T _A	D_{N min} = Min. hub outer diam. depending of the given hub yield point Rp0,2
L₁ = Overall length (without screws)	n_{sc} = Quantity of screws	T_{max} = Max. transmissible torque
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A		

Technical Information

- The Locking Assemblies are supplied slightly oiled and ready-to-use. The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies in delivery condition.
- Surface finishes: For shaft and hub bore R_a ≤ 3,2 μm
- Tolerances: Shaft: k9-h9 · Hub: N9-H9
Max. permissible: Shaft: k11-h11; Hub: N11-H11
- To avoid excessive deformations of the relatively thickwalled thrust rings, the Locking Assembly should be located as symmetrically as possible between shaft and hub bore. If the shaft is smaller than nominal d, the bore should exceed nominal D to the same extent and vice versa. The concentricity quality is determined by the direct centering between shaft and hub.
- If several Locking Assemblies are to be installed the transmission values of the table can be added when the Locking Assemblies are located within a distance of 4 · L.
- The Locking Assemblies are equipped with 12.9 grade screws. A reduction of the screw tightening torque is possible. Please contact our specialists for assistance.
- To facilitate removal, the front thrust rings have auxiliary threads.
- The outside diameter of the hub is calculated with factor C3 = 0.6. (see chapter „Calculation“ in Product Paper & Tech Paper „RINGFEDER® Locking Assemblies“).

Locking Assemblies RINGFEDER® RfN 7012.2

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	G_w = Weight
D = Outer diameter	p_w = Surface pressure on shaft at given T _A	D_{N min} = Min. hub outer diam. depending of the given hub yield point Rp0,2
L = Overall length	p_N = Surface pressure on hub at given T _A	T_{max} = Max. transmissible torque
L₁ = Overall length (without screws)	n_{sc} = Quantity of screws	
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A	T_A = Tightening torque of the clamping screws	

Technical Information

- The Locking Assemblies are supplied slightly oiled and ready-to-use. The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies in delivery condition.
- Surface finishes: For shaft and hub bore R_a ≤ 3,2 μm
- Tolerances: Shaft: k9-h9 · Hub: N9-H9
Max. permissible: Shaft: k11-h11; Hub: N11-H11
- To avoid excessive deformations of the relatively thickwalled thrust rings, the Locking Assembly should be located as symmetrically as possible between shaft and hub bore. If the shaft is smaller than nominal d, the bore should exceed nominal D to the same extent and vice versa. The concentricity quality is determined by the direct centering between shaft and hub.
- If several Locking Assemblies are to be installed the transmission values of the table can be added when the Locking Assemblies are located within a distance of 4 · L.
- A reduction of the screw tightening torque is possible. Please contact our specialists for assistance.
- To facilitate removal, the front thrust rings have auxiliary threads.
- The outside diameter of the hub is calculated with factor C3 = 0.6. (see chapter „Calculation“ in Product Paper & Tech Paper „RINGFEDER® Locking Assemblies“).

Explanation

d = Inner diameter	T = Transmissible torque at given T _A	T_A = Max tightened torque of the clamping screws
D = Outer diameter	F_{ax} = Transmissible axial force	G_w = Weight
D_{B1} = Collar outer diameter	p_w = Surface pressure on shaft at given T _A	D_{N min} = Min. hub outer diam. depending of the given hub yield point Rp _{0,2}
L = Overall length	p_N = Surface pressure on hub at given T _A	T_{max} = Max. transmissible torque
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
L₃ = Width of ring	D_G = Thread	
L₄ = Installation length up to collar		

Ordering example

Locking assembly	d	D
RfN 7013.1	150	200

Technical Information

- The Locking Assemblies are supplied slightly oiled and ready-to-use. The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies installed in the delivery condition.
- Surface finishes: Shaft and hub bores R_a ≤ 1,6 μm
- Tolerances: Shaft: h8 · Hub: H8
- Arrangement only possible from 2 sides. If several Locking Assemblies are used to increase the transmission values the clamping systematization has to be considered.
- A change of the T_A-values given in the above table is not admissible.
- The outside diameter of the hub is calculated with factor C3 = 0.6. (see chapter „Calculation“ in Product Paper & Tech Paper „RINGFEDER® Locking Assemblies“).

Locking Assemblies RINGFEDER® RfN 7014

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	T_A = Tightening torque of the clamping screws
D = Outer diameter	p_W = Surface pressure on shaft at given T _A	G_w = Weight
L = Overall length	p_N = Surface pressure on hub at given T _A	D_{N min} = Min. hub outer diam. depending of the given hub yield point Rp0,2
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	T_{max} = Max. transmissible torque
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A		

Technical Information

- The values for T, F_{ax}, p_W and p_N apply to Locking Assemblies installed in oiled condition.
- Surface finishes: Shaft and hub bores R_a ≤ 3,2 μm
- Tolerances: Shaft: k9-h9 · Hub: N9-H9
- Max. two Locking Assemblies at most can be installed in series. In this case the transmission values of the above table are doubled.
- A reduction of the contact pressures and the transmission values by reducing the tightening torque of the screws is possible. Please contact our specialists for assistance.
- For the removal of the Locking Assembly a step in the hub or shaft is required (as shown in the installation situation).

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	T_A = Tightening torque of the clamping screws
D = Outer diameter	p_w = Surface pressure on shaft at given T _A	G_w = Weight
L = Overall length	p_N = Surface pressure on hub at given T _A	D_{N min} = Min. hub outer diam. depending of the given hub yield point Rp0,2
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	T_{max} = Max. transmissible torque
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A

Further information on RINGFEDER® RfN 7015.1 on www.ringfeder.com

Technical Information

- The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies installed in oiled condition.
- Surface finishes: Shaft and hub bores R_a ≤ 3,2 μm
- Tolerances: Shaft: h8 · Hub: H8
- Max. two Locking Assemblies can be used in series, the transmissible torques and axial forces are added.
- A reduction of the contact pressures and the transmission values by reducing the tightening torque of the screws is possible. Please contact our specialists for assistance.

Explanation

d = Inner diameter	L₈ = Overhang length	T_A = Max tightened torque of the clamping screws
D = Outer diameter	T = Transmissible torque at given T _A	G_w = Weight
d₁ = Pitch circle diameter	F_{ax} = Transmissible axial force	
D_{B1} = Collar outer diameter	p_w = Surface pressure on shaft at given T _A	
L = Overall length	p_n = Surface pressure on hub at given T _A	
L₁ = Overall length (without screws)	n_{sc} = Quantity of screws	
L₄ = installation length up to collar	D_G = Thread

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	G_w = Weight
D = Outer diameter	p_W = Surface pressure on shaft at given T _A	D_{N min} = Min. hub outer diameter depending of the given hub yield point Rp0,2
L = Overall length	p_N = Surface pressure on hub at given T _A	
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A	T_A = Tightening torque of the clamping screws	

Ordering example

Locking Assembly	d	D
RfN 7515	150	200

Technical Information

- The values for T, F_{ax}, p_W and p_N apply to Locking Assemblies installed in oiled condition.
- Surface finishes: Shaft bore R_a ≤ 1,6 µm · Hub bore R_a ≤ 3,2 µm
- Tolerances: Shaft: h8 · Hub: H8
- The outside diameter of the hub is calculated with factor C3 = 0.6. (see chapter „Calculation“ in Product Paper & Tech Paper „RINGFEDER® Locking Assemblies“).
- A reduction of the contact pressures and the transmission values by reducing the tightening torque of the screws is possible. Please contact our specialists for assistance.

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	G_w = Weight
D = Outer diameter	p_w = Surface pressure on shaft at given T _A	D_{N min} = Min. hub outer diameter depending of the given hub yield point Rp _{0,2}
L = Overall length	p_N = Surface pressure on hub at given T _A	T_{max} = Max. transmissible torque
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
L₃ = Width of ring	D_G = Thread	
T = Transmissible torque at given T _A	T_A = Tightening torque of the clamping screws	

Technical Information

- The Locking Assemblies are supplied slightly oiled and ready-to-use. The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies in delivery condition.
- Surface finishes: For shaft and hub bore R_a ≤ 3,2 μm
- Tolerances: Shaft: k9-h9 · Hub: N9-H9
Max. permissible: Shaft: k11-h11; Hub: N11-H11
- To avoid excessive deformations of the relatively thickwalled thrust rings, the Locking Assembly should be located as symmetrically as possible between shaft and hub bore. If the shaft is smaller than nominal d, the bore should exceed nominal D to the same extent and vice versa. The concentricity quality is determined by the direct centering between shaft and hub.
- If several Locking Assemblies are to be installed the transmission values of the table can be added when the Locking Assemblies are located within a distance of 4 · L .
- The Locking Assemblies are generally equipped with screws of quality A4 BUMAX 109. A reduction of the screw tightening torque is possible. Please contact our specialists for assistance.
- To facilitate removal, the front thrust rings have auxiliary threads.
- The outside diameter of the hub is calculated with factor C3 = 0.6. (see chapter „Calculation“ in Product Paper & Tech Paper „RINGFEDER® Locking Assemblies“).

Explanation

d = Inner diameter	T = Transmissible torque at given T _A	T_A = Max tightened torque of the clamping screws
D = Outer diameter	F_{ax} = Transmissible axial force	G_w = Weight
D_{B1} = Collar outer diameter	p_w = Surface pressure on shaft at given T _A	T_{max} = Max. transmissible torque
L = Overall length	p_N = Surface pressure on hub at given T _A	
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
L₃ = Width of ring	D_G = Thread	
L₄ = Installation length up to collar		

Ordering example

Locking assembly	d	D	Further details
RfN 7013.1 stainless steel	35	60	SST (=stainless steel)

Further information on RINGFEDER® RfN 7013.1 stainless steel on www.ringfeder.com

Technical Information

- The Locking Assemblies are supplied slightly oiled and ready-to-use. The values for T, F_{ax}, p_w and p_N apply to Locking Assemblies installed in the delivery condition.
- Surface finishes: Shaft and hub bores R_a ≤ 1,6 μm
- Tolerances: Shaft: h8 · Hub: H8
- Arrangement only possible from 2 sides. If several Locking Assemblies are used to increase the transmission values the clamping systematization has to be considered.
- A change of the T_A-values given in the above table is not admissible.

Locking Assemblies RINGFEDER® RfN 7061 stainless steel

Locking Assembly dimensions					Transmissible torques or axial forces		Surface pressure		Locking screws			
d	x	D	L	L ₁	T	F _{ax}	Shaft p _W	Hub p _N	n _{Sc}	D _G	T _A	G _w
mm			mm		Nm	kN	N/mm ²				Nm	kg
42	x	75	44	36	930	42	127	49	6	M8	34	0,75
45	x	75	44	36	1007	42	120	49	6	M8	34	0,7
48	x	80	44	36	1433	58	151	63	8	M8	34	0,8
50	x	80	44	36	1472	58	143	63	8	M8	34	0,76

More sizes on request

Explanation

d = Inner diameter	F_{ax} = Transmissible axial force	D_G = Thread
D = Outer diameter	p_W = Surface pressure on shaft at given T _A	T_A = Max tightened torque of the clamping screws
L = Overall length	p_N = Surface pressure on hub at given T _A	G_w = Thread
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
T = Transmissible torque at given T _A		

Ordering example

Locking assembly	d	D	Further details
RfN 7061 stainless steel	25	47	SST (=stainless steel)

Technical Information

- Surface finishes: Shaft and hub bores $R_a \leq 3,2 \mu\text{m}$
- Tolerances: Shaft: h8 · Hub: H8

More sizes on request

Explanation

d = Inner diameter	T = Transmissible torque at given T _A	T_A = Tightening torque of the clamping screws
D = Outer diameter	F_{ax} = Transmissible axial force	G_w = Weight
D_{B1} = Collar outer diameter	p_w = Surface pressure on shaft at given T _A	
L = Overall length	p_N = Surface pressure on hub at given T _A	
L₁ = Overall length (without screws)	n_{Sc} = Quantity of screws	
L₄ = installation length up to collar	D_G = Thread
